Assignment-5

Prepaid By
~pintu mer

1. A user reports their laptop won't power on even when plugged in. List 5 troubleshooting steps you would take to diagnose the cause, and for each step, explain what you are checking for.

➤ Laptop Power Problem

❖ 5 Steps

1. **Check the charger**
→ Check whether the charger is connected properly and the charging light is ON.
2. **Try another power socket**
→ Check if the wall socket is working correctly.
3. **Check the charging port**
→ Check if the laptop charging port is loose or damaged.
4. **Power reset the laptop**
→ Remove the charger, hold the power button for 15–20 seconds, then connect the charger and try again.
5. **Check the battery**
→ If possible, remove/disconnect the battery and try turning on the laptop with the charger only.

Conclusion: These steps help find whether the problem is with the charger, power socket, charging port, battery, or laptop hardware.

2. You receive a helpdesk ticket: 'My monitor is showing a blank screen, but the CPU seems to be running.' Write a step-by-step troubleshooting flow you would follow to identify and resolve the issue. Hint: Consider checking both hardware connections and basic display settings.

❖ Blank Monitor – Troubleshooting Flow

1. **Check power**
→ Make sure the monitor is ON and the power light is working.
2. **Check display cable**
→ Check HDMI/DisplayPort/VGA cable on both ends. Make sure it is connected properly.

3. **Check the correct input**

→ Select the correct HDMI/DP/VGA input on the monitor.

4. **Check the GPU connection**

→ Make sure the graphics card is properly connected. If a GPU is installed, connect the monitor cable to the GPU port.

5. **Restart the PC**

→ Turn off the PC and monitor, wait a few seconds, then turn them ON again.

6. **Test with another cable/monitor**

→ This helps check whether the problem is with the cable or monitor.

7. **Check display settings**

→ If the display works, check Windows display settings and resolution.

Conclusion: If the monitor works after these checks, the problem was likely a loose cable, wrong input, or display setting.

3. A user complains that their wireless mouse is unresponsive, but the keyboard works fine. Describe how you would isolate whether the issue is with the mouse, the USB port, or the system settings.

❖ **Wireless Mouse Problem – Steps**

1. **Check the mouse battery**

→ Replace the battery or charge the mouse and check if it works.

2. **Check the USB receiver**

→ Remove the wireless receiver and plug it into another USB port.

→ If it works, the old USB port may have a problem.

3. **Test the mouse on another PC**

→ If it does not work there also, the mouse may be faulty.

4. **Check system settings**

→ Check Settings → Bluetooth & Devices → Mouse and make sure the mouse is detected.

5. **Restart the PC**

→ Restart the computer and reconnect the mouse receiver.

Conclusion

- Works on another PC → System/USB issue
- Does not work on another PC → Mouse issue
- Works in another USB port → USB port issue

**4. Imagine you are working on a helpdesk team for a gaming cafe. One system is overheating and shutting down during use. List 3 possible hardware causes and describe how you would check each one.

Hint: Think about fans, dust, and thermal paste.**

❖ Gaming PC Overheating – 3 Causes

1. Dust in the PC

- Cause: Dust blocks airflow and makes cooling difficult.
- Check: Open the case and check the fans, heatsink, and vents for dust.

2. Fan not working

- Cause: CPU/GPU fan may be stopped or spinning slowly.
- Check: Turn on the PC and see if the fans are spinning properly.

3. Old or dry thermal paste

- Cause: Thermal paste helps transfer heat from the CPU to the cooler.
- Check: Remove the CPU cooler and check if the thermal paste is dry or cracked. Replace it if needed.
